SkilloVilla AI Career Accelerator

Final Project Presentation & Documentation

Project: AI Career Accelerator – 30 Days to Industry Ready

Target audience: Final-year engineering students preparing for internships and placements.

Project tasks: Structured Prompting Architecture → Structured Visual Ad Sequence → n8n Lead Handling Workflow

This document consolidates the final Task 1 messaging prompt and output, the five approved Task 2 visuals, and the supplied Task 3 n8n/Google Sheets evidence.

1. Project Overview

• The project connects three AI-assisted stages of a career campaign.

• Task 1 defines the audience problem, campaign territory, messaging, and claim boundaries.

• Task 2 converts the campaign into a five-scene visual story with a consistent student character.

• Task 3 turns a campaign response into a structured lead-handling workflow in n8n.

• The final flow is: **Messaging** → **Visual Story** → **Lead Automation**.

Defined program benefits used throughout:

• AI-powered portfolios

• Practical system-building skills

• Internship and placement preparation

2. Task 1 — Structured Prompting Architecture

Purpose: turn completed audience insights into controlled campaign messaging without inventing program features or making outcome guarantees.

Prompt structure: Context → Audience → Benefit constraints → Audience insight → Transformation → Campaign task → Claim check → Quality check.

Why structure matters: each section gives the model a specific decision boundary. This reduces generic advertising language and keeps the output tied to the defined benefits.

Final Task 1 Prompt — supplied by the project owner

```
You are the campaign messaging strategist using the completed
CPTS Career Messaging Framework.

CONTEXT:
SkilloVilla is launching:
"AI Career Accelerator – 30 Days to Industry Ready"

TARGET AUDIENCE:
Final-year engineering students preparing for internships and placements.

USE ONLY THESE DEFINED PROGRAM BENEFITS:
1. AI-powered portfolios
2. Practical system-building skills
3. Internship and placement preparation

Do not add, modify, or invent program features.
Do not promise employment, job placement, salary increases, selection,
or guaranteed outcomes.

AUDIENCE INSIGHT:

The strongest recurring problems are:

1. Students may know engineering concepts but lack enough demonstrable
practical work.
2. Students may be uncertain about their practical and placement readiness.
3. Students may perceive that other students are further ahead.

Strongest motivations:

1. Build something tangible before placement conversations begin.
2. Turn fragmented knowledge into practical capability.
3. Replace uncertainty with focused preparation.

Strongest transformation:

FROM:
"I've studied engineering concepts, but I'm uncertain about how well
I can demonstrate practical capability."

TO:
"I have AI-powered portfolio work, practical system-building experience,
and focused preparation for internship and placement processes."

CORE CAMPAIGN TERRITORY:

Move from having learned concepts to having practical AI work,
system-building experience, and focused preparation that can be
demonstrated during the internship and placement journey.

TASK:

Create the campaign messaging in the following order:

1. CORE VALUE PROPOSITION
Write one clear value proposition in 1–2 sentences.

2. HEADLINE
Create 5 possible campaign headlines.

For each headline, briefly explain the messaging angle.

3. SELECT A FINAL HEADLINE
Choose the headline that best represents the complete campaign
message and explain why it fits the audience and defined benefits.

4. PERSUASIVE CAMPAIGN SCRIPT
Write one persuasive campaign script of MAXIMUM 300 WORDS.

The script should follow this structure:

Problem → Emotional tension → Shift in perspective →
Program benefits → Transformation → Call to action

The script should sound relevant to a final-year engineering student,
not like generic corporate advertising.

5. THREE SUPPORTING ARGUMENTS
Provide exactly 3 short supporting arguments.

Each argument must connect directly to one of the three defined
program benefits.

6. CLAIM CHECK
Review the final messaging and identify any sentence that could
accidentally imply:
- guaranteed employment
```

- guaranteed placement
- guaranteed selection
- guaranteed salary improvement

Rewrite anything that creates such an implication.

FINAL QUALITY CHECK:
- Stay within the three defined benefits.
- Keep the student as the central character.
- Keep the emotional tension realistic.
- Do not exaggerate.
- Do not use unsupported statistics.
- Keep the campaign focused on preparation, practical capability, and demonstrable work.

3. Task 1 — Final Campaign Output

Core Value Proposition

Turn what you've learned in engineering into practical AI work you can demonstrate. In 30 days, build AI-powered portfolio work, develop practical system-building skills, and prepare with greater focus for internships and placements.

Five headline options

Headline	Messaging angle
From Learning to Building. From Building to Showing.	Connects learning, practical building, and demonstrable work.
Don't Just Learn AI. Build What You Can Show.	Shifts the focus from theory to tangible proof of capability.
30 Days to Turn Your Skills Into Something You Can Show	Uses the 30-day timeframe as a focused preparation window.
Your Final Year. Your 30-Day Build.	Makes the final-year moment and practical action central.
Stop Wondering If You're Ready. Start Building Toward It.	Addresses uncertainty while avoiding a promise of guaranteed readiness.

Selected final headline: From Learning to Building. From Building to Showing.

It represents the complete campaign path: learning → practical building → demonstrable work, while remaining aligned to the three defined benefits.

Persuasive campaign script

You've spent years learning engineering concepts.

But as internships and placements get closer, a different question starts to matter:

"Can I actually demonstrate what I can do?"

Maybe you understand the concepts but don't have enough practical work to show. Maybe you know several technologies but haven't yet connected them into something you can confidently explain. Or maybe you're looking at other students' projects and wondering if you're prepared enough.

The answer isn't simply to keep collecting more theory.

It's to start turning what you know into something tangible.

SkilloVilla's AI Career Accelerator – 30 Days to Industry Ready is designed around that shift.

Build AI-powered portfolios that give you practical work to demonstrate.

Develop practical system-building skills so you can move from individual concepts toward working systems.

And focus your preparation through internship and placement preparation as you approach the next stage of your engineering journey.

The goal is not to promise where your career will end up.

It's to help you move from:
"I've studied it, but can I demonstrate it?"
to:
"I have practical work, system-building experience, and focused preparation I can bring into my internship and placement journey."

Your final year is already moving.

Use the next 30 days to turn learning into building—and building into something you can show.

Three supporting arguments

• Build something tangible — AI-powered portfolios help develop practical AI work to demonstrate and discuss.

• Turn concepts into systems — practical system-building bridges individual concepts and working systems.

• Prepare with purpose — internship and placement preparation focuses effort on the upcoming stage of the engineering journey.

Claim check

Risk: “30 Days to Industry Ready” could be interpreted as a guaranteed outcome.
Handling: Ground the supporting copy in practical work, system-building skills, and preparation; avoid implying guaranteed readiness or employment.

Risk: Statements about being prepared could sound like guaranteed placement readiness.
Handling: Use “focused preparation” and “move toward” language rather than promising selection or placement.

Clear boundary: No claims of employment, placement, selection, or salary improvement.
Handling: Keep the student’s practical capability and demonstrable work at the center.

4. Task 2 — Structured Visual Ad Sequence

The five supplied visuals form the final approved sequence. The narrative moves from uncertainty and comparison toward direction, practical building, and demonstration.

Scene 1 — Problem — Uncertainty

Student is reflective and unsure about whether learning is enough to demonstrate practical capability.

Scene 2 — Escalation — Competitive pressure

Student sees peers working on projects, increasing the feeling of being behind.

Scene 3 — Introduction of solution — Direction

Student has a clearer, structured project/system on screen and begins moving toward practical action.

Scene 4 — Transformation — Building

Student is actively working with a practical AI/system project and appears more engaged and confident.

Scene 5 — CTA — Demonstration

Student confidently presents completed work with negative space for campaign copy/CTA.

5. Task 2 — Consistency & Refinement Notes

• The same fictional engineering student is carried across the five scenes: curly dark hair, rectangular glasses, navy shirt, and consistent overall appearance.

• The environment remains a modern engineering/AI project lab, supporting continuity across scenes.

• The emotional progression changes while the visual identity remains stable: uncertain → pressured → directed → building → demonstrating.

• Scene 5 reserves visual space on the left, making it suitable for final campaign copy/CTA placement.

Prompt evidence limitation: the exact Task 2 generation/refinement prompts were not included in the material supplied with this final package. The five final outputs are documented here without inventing prompt text.

6. Task 3 — n8n Lead Handling Workflow

Workflow objective: receive a student lead, prepare the data, store it in Google Sheets, route the lead by interest level, prepare a category-specific response, and log the action taken.

• Receive Student Lead

• Prepare Student Data

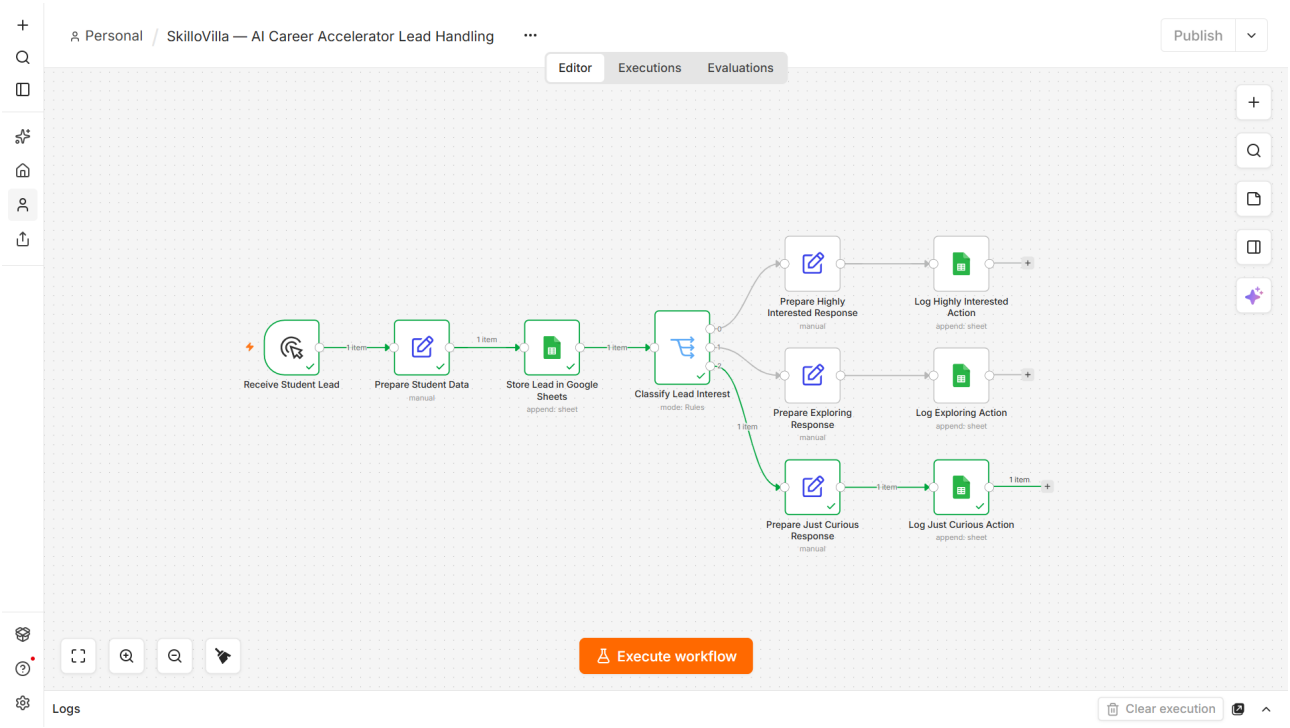
• Store Lead in Google Sheets

• Classify Lead Interest

• Prepare Highly Interested Response → Log Highly Interested Action

• Prepare Exploring Response → Log Exploring Action

• Prepare Just Curious Response → Log Just Curious Action



Supplied n8n workflow screenshot showing the complete branching workflow.

7. Task 3 — Classification Logic

Category	Routing condition	Action
Highly Interested	Interest field equals “Highly Interested”	Prepare a highly interested response and log the action.
Exploring	Interest field equals “Exploring”	Prepare an exploring response and log the action.
Just Curious	Interest field equals “Just Curious”	Prepare a just-curious response and log the action.

• **Why categories?** They allow the prototype to prepare different follow-up responses based on stated interest.

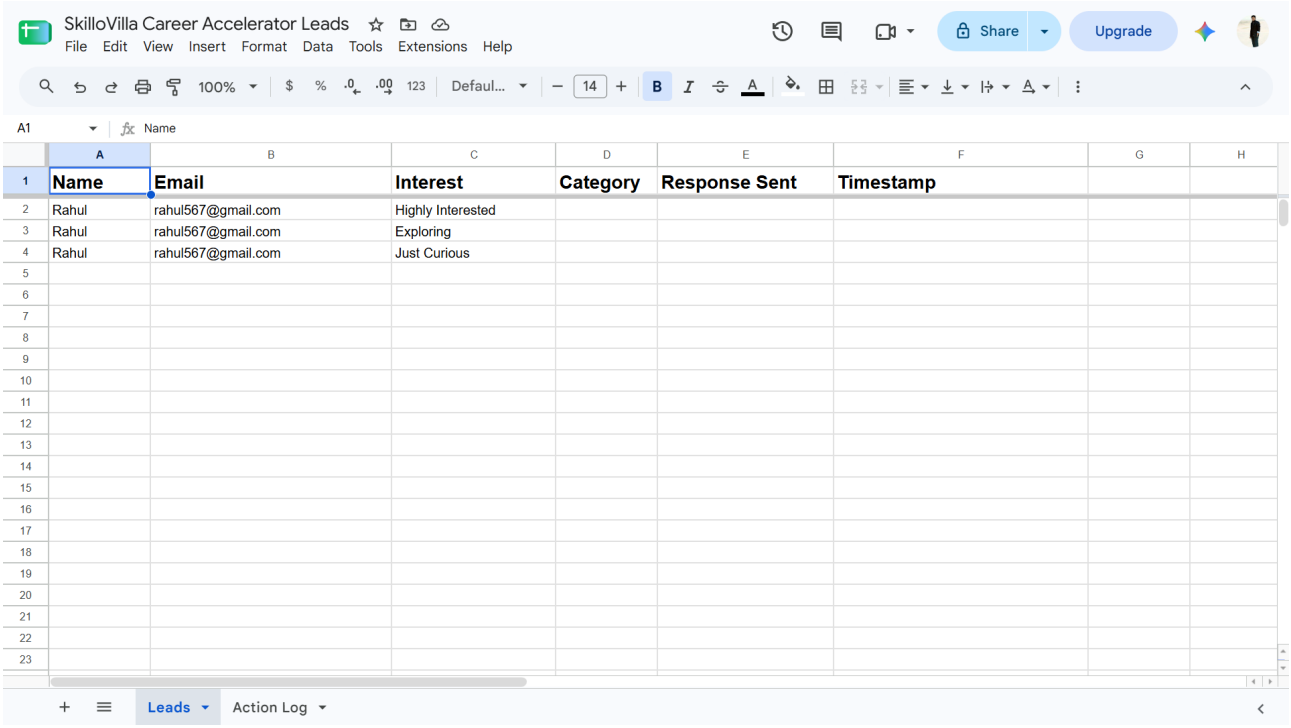
• **Data used:** Name, Email, Interest, Category, Response Sent, Timestamp in Leads; Name, Email, Category, Action Taken, Timestamp in Action Log.

• **Transformation:** Edit Fields nodes prepare student data and response/action payloads before the next step.

• **Mock email handling:** the workflow prepares response content rather than sending a real email, which satisfies the prototype requirement without making an external delivery.

8. Task 3 — Google Sheets Evidence

Leads tab



Name	Email	Interest	Category	Response Sent	Timestamp
Rahul	rahul567@gmail.com	Highly Interested			
Rahul	rahul567@gmail.com	Exploring			
Rahul	rahul567@gmail.com	Just Curious			

The supplied Leads screenshot shows test entries for the three interest categories.

Action Log tab

	A	B	C	D	E	F	G
1	**Name**	**Email**	**Category**	**Action Taken**	**Timestamp**		
2	Rahul	rahul567@gmail.com	Highly Interested	Highly Interested response prepared	2026-09-30T08:44:09.150+05:30		
3	Rahul	rahul567@gmail.com	Exploring	Exploring response prepared	2026-09-30T08:45:18.012+05:30		
4	Rahul	rahul567@gmail.com	Just Curious	Just Curious response prepared	2026-09-30T08:45:51.065+05:30		

The supplied Action Log screenshot shows a category-specific action and timestamp for each test.

9. Testing Evidence & Practical Learning

• The workflow was tested for all three categories: Highly Interested, Exploring, and Just Curious.

• The Action Log records the corresponding response-preparation action for each category.

• A configuration issue occurred when the Google Sheets input contained a static Interest value. This caused the Switch to route leads to the same branch.

• The issue was corrected by mapping the Interest value dynamically from the student data, allowing the Switch rules to route each test category correctly.

• This demonstrates an important automation lesson: configuration can be syntactically valid while still being logically wrong if data is hard-coded instead of mapped dynamically.

10. Learnings

• Structured prompting made the campaign logic explicit instead of relying on a single generic request.

• The Task 1 prompt constrained the model to the three defined program benefits and required a claim check.

• The visual sequence translated the campaign from words into a five-stage emotional progression.

• Consistent character, environment, wardrobe, and cinematic style helped reduce visual drift across the five scenes.

• The n8n workflow showed how a lead can move from intake to storage, classification, response preparation, and action logging.

• Testing each category exposed a real mapping issue: a static Interest value can force every lead into one Switch branch; dynamic mapping fixed it.

11. Limitations & Production Improvements

• The Task 2 exact image-generation and refinement prompts were not included in the materials supplied for this final documentation, so they are not reproduced or invented here.

• The n8n email step is represented by mock response outputs rather than actual outbound email delivery.

• The lead classifier uses a manually supplied Interest category in this prototype; a production system would need a defined scoring/classification method from form responses.

• The Google Sheet evidence contains test records rather than a live production lead stream.

• The visual sequence demonstrates campaign storytelling but does not measure audience response or conversion performance.

• “Industry Ready” is the official program name; the documentation intentionally grounds the claim in the three defined benefits rather than treating it as a guaranteed outcome.

Potential production improvements:

• Replace manual category input with a defined classification/scoring method based on form responses.

• Use an actual email service node after validating message templates and consent requirements.

• Add error handling for missing email/name/interest values and Google Sheets failures.

• Add duplicate-lead detection and structured status fields.

• Track response delivery and downstream outcomes rather than only response preparation.

• Validate the visual/message sequence with real audience feedback before treating it as campaign performance evidence.

12. Conclusion — End-to-End Project Connection

Task 1 — Think: structured prompting converts audience insight into constrained campaign messaging.

Task 2 — Show: the campaign message becomes a consistent five-scene visual narrative.

Task 3 — Act: student responses become structured lead records, categorized follow-up, and logged actions.

Final project flow:

Audience insight → Campaign message → Visual ad → Student lead → Google Sheets → Interest classification → Response preparation → Action log

The project demonstrates how prompting, image generation, and workflow automation can be combined into one connected AI-assisted campaign system while keeping the defined program benefits and claim boundaries explicit.

Appendix — Evidence Checklist

✓ Final Task 1 prompt included

✓ Final Task 1 campaign output included

✓ Five final Task 2 visuals included

✓ n8n workflow screenshot included

✓ Google Sheets Leads screenshot included

✓ Google Sheets Action Log screenshot included

✓ Learnings included

✓ Limitations included

✓ Conclusion and Task 1 → Task 2 → Task 3 connection included
